

Hainan Agarwood Oud Oil Pure Dew Non Dilution Distillation Extract Natural Moisturizing Cleansing

Our Product Introduction

for more products please visit us on oudagarwood.com

Basic Information

- Place of Origin: CHINA
- Brand Name: LONGSHENG
- Certification: ISO
- Minimum Order Quantity: 10g
- Delivery Time: 1~3work daiy
- Payment Terms: L/C, D/A, D/P, T/T, Western Union, MoneyGram

Product Specification

- Product Name: Longsheng
- Producing Area: Guangdong
- Deposit: Moisture-proof, Avoid Sunlight Refraction
- Specifications: White Jade Crystal Bottle
- Weight: 3ml/2ml/1ml
- Brand: Baopu Yaji
- Aroma: Water Distillation 1ML, Water Distillation 2ML, Water Distillation 3ML, Supercritical 1ML, Supercritical 2ML, Supercritical 3ML
- Highlight: hainan agarwood oud oil,
agarwood oud oil pure dew,
hainan agarwood oud essential oil

Product Description

Agarwood essential oil aromatherapy perfume distillation calms the nerves without adding pure natural supercritical auth

Water distillation extraction is more pure

By heating the mixture of agarwood powder and water, the agarwood oil is dissolved, and the small molecules of volatile agarwood are volatilized together with the water vapor. The crude oil is obtained from the oil-water separator through the liquefaction of the condenser tube, and the more pure and clear agarwood essential oil is obtained through the separation and distillation again. The water distillation extraction method is extremely consumable. Only about 10kg of agarwood raw materials can get about 10g of agarwood essential oil.

Agarwood is scarce and noble since ancient times

The essential oil of agarwood is rare and precious. Because of its mysterious and elegant fragrance, it has always been the fixative of well-known perfume. In ancient India, it was regarded as a sacred product for worshipping Buddha. In Arab countries, agarwood essential oil is a regular part of national life.

Differences in essential oils

① Different processes and components

The high-temperature water distillation extraction process evaporates small molecules of essential oil with water vapor, resulting in only highly volatile small molecules and a more refined composition. Supercritical CO₂ is used for extraction with high-pressure liquid CO₂ as the solvent. The essential oil contains resin and plant wax, as well as non-volatile substances such as chromones, triterpenes, carrageenans, and furanic acid, resulting in a more complete composition.

② Different components have different fluidity

Supercritical CO₂ is used to extract essential oils that contain resin and plant wax, as well as non-volatile substances such as chromones, triterpenes, carrageenans, and furanic acid, making essential oils more coagulable; The essential oil extracted by water distillation is only high volatile small molecule essence, and the essential oil has more fluidity.

③ The initial fragrance of water distillation is stronger, and the lingering fragrance is more long-lasting

The essential oil extracted by water distillation is only high volatile small molecule essence, which is more easily absorbed by human skin; The initial fragrance is stronger, and the coolness is more abundant; More pure fragrance, without the smell of wood; The fragrance lasts for a long time, and only a small amount can last for a day. With oxidation, the fragrance becomes more mellow and elegant.

④ Supercritical initial fragrance for a more elegant and complete fragrance

Supercritical CO₂ extraction, due to the complete inclusion of agarwood substances in the raw material, has a soft initial aroma and complete front, middle, and tail rhymes; Due to the retention of non-volatile substances such as chromones, triterpenes, karaketones, and furanic acid in agarwood, the changes in aroma and agarwood raw materials are closer.

Supercritical CO extraction, due to the complete inclusion of agarwood substances in the raw material, has a soft initial aroma and complete front, middle, and tail rhymes; Due to the retention of non-volatile substances such as chromones, triterpenes, karaketones, and furanic acid in agarwood, the changes in aroma and agarwood raw materials are closer.
